*The Index Theorem for Quasi-Tori*

3:00 – 4:00pm

**Abstract**

The Index Theorem for holomorphic line bundles on complex tori asserts that some cohomology groups of a line bundle vanish according to the signature of the associated hermitian form. In this article, this theorem is generalized to quasi-tori, i.e. connected complex abelian Lie groups which are not necessarily compact. In view of the Remmert-Morimoto decomposition of quasi-tori as well as the Künneth formula, it suffices to consider only Cousin-quasi-tori, i.e. quasi-tori which have no non-constant holomorphic functions. The Index Theorem is generalized to holomorphic line bundles, both linearizable and non-linearizable, on Cousin-quasi-tori using $L^2$-methods coupled with the Kazama-Dolbeault isomorphism and Bochner-Kodaira formulas.

*Canonical maps of surfaces defined by Abelian covers*

4:15 – 5:15pm

**Abstract**

We classify the surfaces whose canonical maps are abelian covers over the projective plane by using abelian covering. Moreover, we give defining equations for Campedelli surface, Perssson’s surface and Tan’s surfaces with odd canonical degrees explicitly. It is a joint work with Rong Du.
